Helping Children to learn

ABA Therapy & Pivotal Response Treatment Course

Approved Intensive Early Intervention Therapy for Children with Autism/ Behavioural Problems/ Learning and Intellectual Disabilities.

Applied Behaviour Analysis (ABA) is a Psychological technique for analysing and modifying behaviours in a wide range of situations. Pivotal Response Treatment (PRT) is the most effective and least costly method of delivering ABA therapy to children.

WHY Pivotal Response Treatment (PRT).

- PRT is an ABA technique developed at the University of California at Santa Barbara, to overcome the many shortcomings of Discrete Trial Learning (DTL) and to be more naturalistic.
- Based on the principles of ABA and DTL, PRT was developed to be less rigid, involve more “natural learning”. It is more enjoyable for the child, parent or therapist and produces faster changes in children.
- PRT has been extensively researched and validated, with over 200 journal articles and books published to-date. PRT promotes attention, motivation, language, social play, empathy and generalisation of learned skills to other areas of functioning.

WHEN: 8:30am – 1:00pm
LAST 2 SATURDAYS OF
EACH MONTH
WHERE: 303 SRINGVALE
ROAD, FOREST HILL, 3131
COST: \$400 P/P

Ideal for parents, teachers, students, aides and carers, as PRT can be used in day to day interactions with the child.

Extensive practice sessions, notes and additional reading material are provided to ensure that all participants become competent at administering ABA using Pivotal Response Treatment
